

# Guía Operativa de Refactorización

Aplicable a TODOS los Controllers y Jobs reales del repositorio. Esta guía define QUÉ refactorizar, CÓMO hacerlo y DÓNDE, sin repetir código innecesariamente.

## 1. Guía para Controllers

Los siguientes controllers existen en el repositorio y deben seguir exactamente el mismo patrón de refactor. No se refactorizan todos de golpe: se priorizan por riesgo (ver diagnóstico Fase 0).

Patrón obligatorio para TODOS los controllers anteriores:

- 1. Crear FormRequest específico en app/Http/Requests/
- 2. Crear DTO de entrada en app/Application//DTO/
- 3. Extraer TODA la lógica a una Action en app/Application//Actions/
- 4. El Controller solo orquesta: Request → DTO → Action → Response

- 5. Prohibido: Stripe, OneSignal, Redis o lógica de negocio en Controllers

Patrón obligatorio para TODOS los Jobs:

- 1. El Job NO contiene reglas de negocio
- 2. El Job solo llama a una Action (Application layer)
- 3. Reintentos e idempotencia se documentan en la Action
- 4. Integraciones externas solo vía interfaces/gateways
- 5. Logs con correlation\_id obligatorios

### 3. Checklist operativo por PR

- ¿Se eliminó lógica del Controller/Job?
- ¿Existe Action clara y testeable?
- ¿No hay llamadas directas a proveedores?
- ¿Se agregaron tests básicos?
- ¿Cumple reglas arquitectónicas v1?

Resultado esperado: cualquier desarrollador puede tomar cualquier controller o job de la lista y refactorizarlo siguiendo esta guía sin tomar decisiones arquitectónicas adicionales.
